

Question 2 merge sort

$A = \{13, 41, 52, 6, 38, 7, 9, 49\}$

$[6 \mid 7 \mid 9 \mid 13 \mid 38 \mid 41 \mid 49 \mid 52]$

Question 3 Bubble Sort

for $i = 1$ to $A.length - 1$

for $j = i + 1$ to $A.length$

if $A[j] < A[i]$

exchange $A[j]$ with $A[i]$

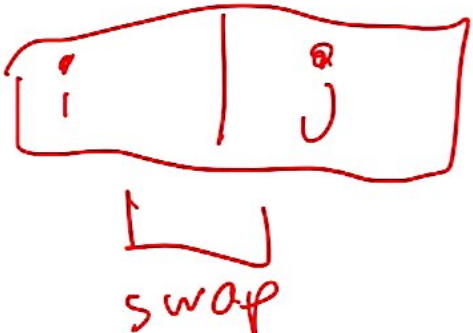

a)

initialization: will only iterate if $array.length \geq 2$

doesn't run otherwise since one element doesn't need to be sorted

Maintenance: in first iteration the first element becomes sorted

• Only swaps neighbors until the end

for example  where $A[i] > A[j]$

We swap until we reach the end of the array, and keep incrementing i with current index to be sorted

Termination: • we exit once we reach the end of the first

loop which is when $i = A.length - 1$

• Since we finished the outer loop, which means we iterated through all indices of the array as well as compared them with all values to its right. Hence we can assume its sorted from small to big.

b) Best and worse case is $\Theta(n^2)$

since we iterate through all values twice, while insertion sort

Best case is $\Theta(n)$ and worse is $\Theta(n^2)$ the same as

insertion sort. Overall insertion sort is more efficient

1	2	3	4	5
---	---	---	---	---

Here despite being sorted $T(n)$ is $\Theta(n^2)$ with Bubble sort

Question 4 (2 credit)

Draw a recursion tree for the recurrence $T(n) = 2T(n/4) + cn^2$ for level 0, 1 and 2. Show the per-level cost of the tree.

$$T(n) = \begin{cases} c, & n=1 \\ 2T(n/4) + cn^2, & n>1 \end{cases}$$

Level 0 $cn^2 \quad \dots \quad cn^2$

Level 1 $c\left(\frac{n}{4}\right)^2 \quad \dots \quad c\left(\frac{n}{4}\right)^2$

Level 2 $c\left(\frac{n}{16}\right)^2 \quad c\left(\frac{n}{16}\right)^2 \quad c\left(\frac{n}{16}\right)^2 \quad c\left(\frac{n}{16}\right)^2 \quad \dots \quad c\left(\frac{n}{16}\right)^2$
